This is the 5. sequence of the clone insert
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKEZ); Email s.wiemann@dKEz- heidelberg.de;
sequenced by AGOWA (Berlin/Germany) within the cDNA sequencing
consortium of the German Genome Project.
This clone (DKEZp781C0628) is available at the RZPD in Berlin.

                            The present invention relates to an isolated nucleic acid encoding a melanoma differentiation associated gene-5 (Mda-5) polypeptide. Mda-5 contains a caspase recruitment domain (CARD) and a RNA helicase motif. Mda-5 is a novel interferon (IrN) inducible gene with structural similarities to RNA helicases and CARD motif containing proteins. Mda-5 is induced during terminal differentiation in human melanoma cells treated with the combination of recombinant fibroblast IFN and the artileukaemic compound mezerain (MEZ). Mda-5 is useful for identifying compounds that may induce its expression. Mda-5 is useful for treating compounds that may induce its expression. Mda-5 is useful for treating cancer e.g., melanoma, neuroblastoma, astrocytoma, glioblastoma multiforme, cervical cancer, breast cancer, colon cancer, prostate cancer of the central nervous system and aspecially where the cancer is a cancer of the central nervous system and apoptosis. The Mda-5 promoter exhibits melanocyte tissue specificity and minimises systemic toxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               540

The method comprises determining the expression level of a marker gene in a biological sample from a subject, comparing the expression level determined with the expression level of the marker gene in a biological sample from a healthy subject, and judging whether the subject has bronchial ashma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (51) whose expression levels increase when respiratory epithalial cells are stimulated with interleukin-13; or (b) a group of genes (52) whose expression levels decrease when respiratory epithalial

cc stimulated with interleukin-13. Also described: (1) a reagent (I) for testing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (3) an inducer that induces bronchial asthma in a mouse; (5) a cathod for producing an animal model for bronchial asthma in a mouse; (5) a cathma or chronic obstructive pulmonary disease; (4) an inducer that induces bronchial asthma or chronic obstructive pulmonary disease; (6) a therapeutic agent for bronchial occid corresponding to a portion of asthma or chronic obstructive pulmonary disease, comprising the compound, a marker gene or an antisense nucleic acid corresponding to a portion of the marker gene through an RNAi effect or an antibody recognising cc a protein encoded by a marker gene; and (7) a DNA chip for testing for expression of the gene through an RNAi effect or an antibody recognising cc a protein encoded by a marker gene; and (7) a DNA chip for testing for concontain asthma or chronic obstructive pulmonary disease, on which a probe has been immobilised to assay a marker gene. (1) has respiratory cc and antisathmatic activities, and can be used in gene therapy. The method is useful for testing for or screening for a therapeutic agent for the bronchial asthma or chronic obstructive pulmonary disease. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                ö

900 900 The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention. RH116 is 116kDa protein and has homology to RNA helicases (DEXH box). RH116 and its coding sequence are useful for treating cancer; acute or chronic infections (especially by HIV or hepatitis B or C); inherited genetic diseases, (auto) immune diseases (particularly rheumatism, arthritis, arteriosclerosis, onseepoporsis and diabetes, but many others listed) an to prevent graft rejection. RH116 and its coding sequence are also useffor inducing, or increasing, the immune response to a vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               LLLSTLEKGVWHLGWTREFVEALRRTGSPLAARYMNPELTDLPSPSFENAHDEYLQLLNL

The invention relates to 971 novel human CDNA sequences (ADC29919-ADC30899) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinent production of a polypeptide of the invention; an antibody gainst a polypeptide of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The identifying a compound which binds to a polypeptide of the invention. The identifying a compound which binds to a polypeptide of the invention. The identifying a compound which binds to a polypeptide of the invention. The invention methods for the identification of compounds that modulate the and/or monoclonal antibodies for carrying out the methods of the invention methods for the identification of compounds that modulate the expression or activity of the polymclectide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention or activity of the polympetides encoded by the contigs (ADC32629) and the polypeptides encoded by the contigs (ADC33861-ADC33627) and the polypeptides encoded by the contigs (ADC33629). The nucleic acids and polypeptides of the invention are activity of data and products dependent on DNA and amino acid sequences. They are disease and other neurodegenerative diseases, anemia, platelet cancer. The nucleic acids may also be used as Mybridiabation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as anemia, platelet and as folds when polypeptide sequence of the invention. Note: The sequence cancer also useful in electronic format date of the printed specification, but sequences of the printed specification, but sequences of the printed specification, but sequences of the printed specification, format date for this patent did not form part o
                                                                                                                                                                                                                                                                                                                                                                                                                         New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or

The present invention relates to an isolated nucleic acid encoding a melanoma differentiation associated gene-5 (Mda-5) polypeptide. Mda-5 contains a caspase recruitment domain (CARD) and a RNA helicase motif. Mda-5 is a novel interferon (IFN) inducible gene with structural similarities to RNA helicase and CARD motif containing proteins. Mda-5 is induced during terminal differentiation in human melanoma cells treated with the combination of recombinant fibroblast IFN and the antileukaemic compound mezerain (MEZ). Mda-5 is useful for identifying compounds that may induce its expression. Mda-5 is useful for reating compounds that may induce its expression. Mda-5 is useful for reating cancer e.g., melanoma, neuroblastoma, astrocytoma, glioblastoma multiforme, cervical cancer, breast cancer, colon cancer, prostate cancer of the central nervous system and especially where the cancer is a cancer of the central nervous system and apoptosis. The Mda-5 promoter exhibits melanocyte tissue specificity and minimises systemic toxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises determining the expression level of a marker gene in a biological sample from a subject, comparing the expression level of the marker gene in a biological sample from a healthy subject, and judging whether the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial colls are stimulated with interleukin-13. Also described: (l) a group of genes (S2) whose expression levels decrease when respiratory epithelial colls are stimulated with interleukin-13. Also described: (l) a reagent (l) for stimulated with interleukin-13. Also described: (l) a reagent (l) for colls are screening for a candidate compound for a therapeutic agent (c) a kit for screening for a candidate compound for a therapeutic agent (c) a kit for screening for bronchial asthma or chronic obstructive pulmonary disease; (4) an inducer that induces bronchial asthma in a mouse; (5) a control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of cont

the

isomerases or ligases. The sequences of the invention are useful in

diagnosis, treatment, prevention and/or prognosis of a wide range of isorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AlDS) autoimmune disorders (e.g. cancer), arthritis), neurological disorders (e.g. Alzheimer's disease), metabolic disorders (e.g. phenylketonuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. haemophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. inflammatory disorders of the invention can also be used in gene therapy. AAU22915-AAU33814 represent the novel human enzyme polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format directly from WIPO at

```

The present invention relates to the isolation of novel human enzyme polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases,

Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                New polynucleotides encoding full-length polypeptides, e.g. secreto: and/or membrane proteins, useful for developing medicines for disean which the gene is involved, or as target molecules for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to novel human secretory or membrane proteins (ADA54072-ADA55710) and their coding sequences (ADA52433-ADA54071). The coding sequences are useful in the gene therapy of diseases caused by abnormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynuclectides are useful in gene therapy. A composition containing a polypeptide or polynuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous system, such as peripheral nervous system diseases, and to as a latchiner's, Parkinson's disease, Huntington's disease, amyotrophic utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemotactic/chemokinetic activity, drug screening, and thrombolytic activity, arcer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification

encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-brager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activity, themoteatic/chemokinetic activity, haemostatic
                                            Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification

The invention relates to 971 novel human CDNA sequences (ADC29919-CC ADC3089) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nuclaic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; and methods of against a polypeptide of the invention; and methods of invention further discloses methods of the invention; and methods of invention further discloses methods of polymelecting or polypeptides of the invention. The invention is medical condition; kits comprising polynucleotide probes and or monclonal antibodies for rarying out the methods of the invention or activity of the journal compounds that modulate the expression or activity of the polymelectide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention are expression or activity of the polymelectide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention are expression of matching and polypeptides of the invention are useful in diagnostics, days screening, foremsics, gene mapping, in the identification of mutations responsible for genetic disorders or other traitie, for assessing biodiversity, and in producing many other types of data and other neurodegenerative diseases such as Parkinson's disease, Alzhaimer's diseases and other neurodegenerative diseases, namemia, placatel the cancer. The nucleic acids may also be used as hybridisation probes or primers, and other neurodegenerating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a human contigener also useful in generating antibodies, as molecular weight markers, and the the recombinant production of a prototic. The sequence data for this patent disouse, as molecular with the present sequence represents a human contigener as also useful in generating anti
                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated polynucleotide (I) comprising a nucleotide sequence selected from any of 948 sequences (ABZ1119-ABZ12066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polynucleotides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABP68902-ABP69849) are useful as molecular weight markers, as a food supplement, for generating antibodies, in medical imaging, screening and diagnostic assays and for treating cell-proliferative diseases (parkinson's or Alzheimer's disease), autoimmune diseases (multiple sclerosis, disease), autoimmune diseases (multiple sclerosis, diabetes, lupus) genetic disorders, myeloid or lymphoid disorders,

length CDNAs defined in the specification. Where a primer set comprises:

[a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 3'-end sequence and an oligonucleotide comprises a 3'-end sequence, where the oligonucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises a 1'-end sequence, where the comprises at least 15 nucleotides and the combination of the 5'-end sequence 3'-end sequence, where the comprises a teast 15 nucleotides and the combination of the 5'-end sequence 3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH13612 to AAH13612 represent thuman amino acid sequences; and AAH13612 to AAH13612 represent in the are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDWAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present invention describes primer sets for synthesising 5602 full-
                                                                                                                                                                                                                                                                                                                                                                       Yamamoto
